

CTG-1000 MBS

Multi-Channel Broadcast System

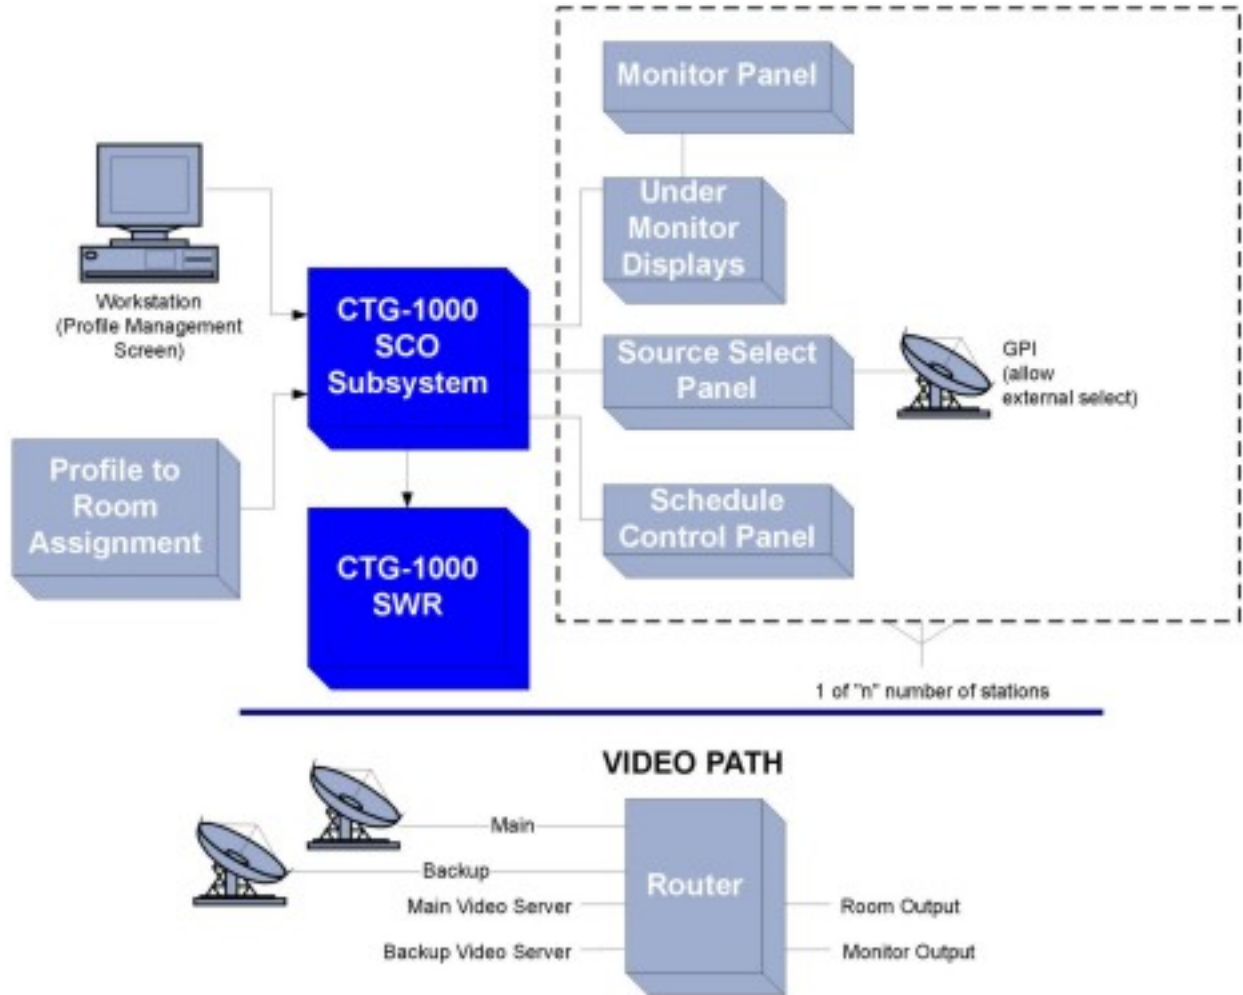

The CTG-1000 MBS System is designed specifically for use in Multi-Channel Broadcast Facilities. This system integrates all the powerful features of the CTG-1000 SWR with additional software modules for Broadcast Operations Control and Sports Integration.

The block diagram below shows the integration of the Broadcast Operations Control (BOC) module with the CTG-1000 SWR to allow centralized monitoring of station channels. Users can monitor up to 120 channels each, select individual channels for closer monitoring, and switch to a trouble slide or backup source.

The next block diagram shows how, with the addition of the Sports Integration (SCO) module, multiple stations can act as their own small master control center to integrate sporting events with local commercials. The stations can also manipulate schedules for playout of commercials during each pod, as well as for commercial recueing and deleting.

CTG-1000 MBS Systems are used in such facilities as the California Broadcast Center, Castle Rock Broadcast Center, and DirecTV, Japan.
